2011 Intro to computer systems

Homework #2

I was able to defuse bomb F with the first password being extent and the second being nasa. Looking at the disassembled file for bomb A allowed me to figure out what the first password was for bomb F which was after line #113. In this area of the machine code the strings that are displayed to the console and the passwords for the bomb are located here. This led me to believe that the next string after extent (SuperSecret) was the second password but that wasn't the case. I don't have great knowledge of assembly code so trying to figure out what exactly the code was doing was a challenge at first. I was able to figure through the first 60 lines of code that a string is taken as input and compared with the true password. This all happens at register two (R2) I think and so I ran the program again and purposely got the second password wrong to see where R2 was pointing to which was x3042 in memory. Looking back at the simulator I went to that location and looked at the next couple lines to see what string it was comparing. This led me to decipher the hexadecimal for the next 3 lines and got nasa. I then reloaded the program and typed in both passwords and successfully defused the bomb.
