

Using Matryoshka dolls I could teach people about nested if statements. First I would go over what if statements are and how you can 'nest' them. In c++, nesting if is essentially putting a if statement inside of another and you are only able to access that statement if the statement prior is true or false. Just like the dolls, open a doll (getting true or false on a prior if statement) will give you access to the next doll inside of it (the nested if statement).
